Abstract:

The persistent "Dark Sector" anomalies, including the Hubble Tension and the "Impossible Early Galaxy" problem identified by JWST, suggest a fundamental misunderstanding of gravitational dynamics. This paper proposes that gravity is not a fundamental force of nature but an emergent entropic phenomenon. Utilizing the **Hamouda Informational Gravity Model (HIGM)**, we demonstrate that the transition of high-energy photons into low-energy infrared states (a 1:20 entropy multiplier) generates a localized informational density within the vacuum. This "Informational Impedance" accounts for galactic rotation curves and galaxy cluster stability without the need for Dark Matter. Furthermore, we establish that the 13.8-billion-year age of the universe is the thermal processing time required for "Pre-Bang" radiation to reach the current Cosmic Microwave Background (CMB) state.

Keywords: *HIGM, Informational Vacuum, Entropy Multiplier, Hubble Tension, Emergent Gravity, Radiative Genesis, Galaxy Clusters.*

1. Introduction: The Death of the Materialist Paradigm

For decades, cosmology has relied on "Dark" entities to patch the holes in General Relativity. However, the 2026 "Crisis in Cosmology" highlights that geometry alone cannot explain the H_0 discrepancy. We propose a "Software-Centric" universe where thermodynamics is the primary layer. The **HIGM** posits that space is an **Informational Vacuum**—an active medium that processes data carried by light.

2. The 1:20 Entropy Multiplier: The Engine of Gravity

The fundamental mechanism of the HIGM is rooted in the thermodynamic degradation of light.

- **Planetary/Stellar Scale:** Observations show that for every high-energy photon absorbed by a body (e.g., Earth), approximately 20 infrared photons are re-emitted.
- **Informational Saturation:** This 1:20 ratio is not merely heat loss; it is a 20-fold multiplication of the "bit-count" in the local vacuum.
- **Emergent Pull:** Gravity is the resulting pressure (Informational Impedance) caused by the vacuum's attempt to organize this sudden surge in entropy.

3. Galactic Stability and the "Fixed Star" Phenomenon

Extending the 1:20 multiplier to galactic scales resolves the flat rotation curve problem.

- **The Informational Anchor:** Galaxies act as massive entropy reservoirs. The cumulative infrared flux from billions of stars creates a "stiff" spacetime.
- **The 9.05% Boost:** This entropic density provides the localized "boost" needed to keep stars fixed in their orbits.
- **Cluster Scaling:** In Galaxy Clusters, the "Entropy Sea" created by the Intracluster Medium (ICM) increases this boost to ~27%, explaining cluster-scale mass discrepancies without Dark Matter.

4. Radiative Genesis and the Hubble Resolution

The "Before the Big Bang" state was a field of pure, massless radiation.

- **Cooling Timeline:** We derive the age of the universe (13.8 Gyr) as the time required for this radiation to cool from the GUT scale (10^{15} GeV) to the CMB scale (1.06×10^{-22} J).

- **Dynamic Expansion:** The Hubble Tension is resolved by recognizing that H_0 is a variable of total information density. The early universe expanded at 67 km/s/Mpc (low entropy), while the modern universe expands at 73.5 km/s/Mpc (high entropy saturation).

5. Conclusion: The Software of the Cosmos

The HIGM provides a unified, testable framework that bridges Quantum Information and General Relativity. By identifying the **Informational Vacuum** as the true driver of cosmic evolution, we offer a stable alternative to the Dark Sector. The predicted 5-microsecond "Entropy Friction" in gravitational waves remains the "smoking gun" for imminent experimental verification.
